## Try before you buy

Download a free sample of any of our exam questions and answers

- ✓ Online Test Engine: Online Tool, Convenient, easy to study. Instant Online Access. Supports All Web Browsers.
- ✓ PDF format: Easy to read and print learning materials, our products are available in PDF file format.
- ✓ Desktop Test Engine: Installable Software Application. Simulates Real Exam Environment. Practice Offline Anytime.

### Security & Privacy

We respect customer privacy. We use McAfee's security service to provide you with utmost security for your personal information & peace of mind.

### 365 Days Free Updates

Free update is available within 365 days after your purchase. After 365 days, you will get 50% discounts for updating.

### Money Back Guarantee

Full refund if you fail the corresponding exam in 60 days after purchasing. And Free get any another product.

### Instant Download

After Payment, our system will send you the products you purchase in mailbox in a minute after payment. If not received within 2 hours, please contact us.

Valid Certification Exam Dumps Materials and Study Guide -  
Lead2Passed

**Exam** : **CCA-410**

**Title** : Cloudera Certified  
Administrator for Apache  
Hadoop CDH4

**Vendors** : Cloudera

**Version** : DEMO

NO.1 Which two updates occur when a client application opens a stream to begin a file write on a cluster running MapReduce v1 (MRv1)?

- A. Once the write stream closes on the DataNode, the DataNode immediately initiates a block report to the NameNode.
- B. The change is written to the NameNode disk.
- C. The metadata in the RAM on the NameNode is flushed to disk.
- D. The metadata in RAM on the NameNode is flushed disk.
- E. The metadata in RAM on the NameNode is updated.
- F. The change is written to the edits file.

**Answer:** E,F

NO.2 For a MapReduce job, on a cluster running MapReduce v1 (MRv1), what's the relationship between tasks and task templates?

- A. There are always at least as many task attempts as there are tasks.
- B. There are always at most as many tasks attempts as there are tasks.
- C. There are always exactly as many task attempts as there are tasks.
- D. The developer sets the number of task attempts on job submission.

**Answer:** A

NO.3 What action occurs automatically on a cluster when a DataNode is marked as dead?

- A. The NameNode forces re-replication of all the blocks which were stored on the dead DataNode.
- B. The next time a client submits job that requires blocks from the dead DataNode, the JobTracker receives no heart beats from the DataNode. The JobTracker tells the NameNode that the DataNode is dead, which triggers block re-replication on the cluster.
- C. The replication factor of the files which had blocks stored on the dead DataNode is temporarily reduced, until the dead DataNode is recovered and returned to the cluster.
- D. The NameNode informs the client which write the blocks that are no longer available; the client then re-writes the blocks to a different DataNode.

**Answer:** A

NO.4 How does the NameNode know DataNodes are available on a cluster running MapReduce v1 (MRv1)

- A. DataNodes listed in the dfs.hosts file. The NameNode uses as the definitive list of available DataNodes.
- B. DataNodes heartbeat in the master on a regular basis.
- C. The NameNode broadcasts a heartbeat on the network on a regular basis, and DataNodes respond.
- D. The NameNode send a broadcast across the network when it first starts, and DataNodes respond.

**Answer:** B

NO.5 Which three distcp features can you utilize on a Hadoop cluster?

- A. Use distcp to copy files only between two clusters or more. You cannot use distcp to copy data between directories inside the same cluster.

- B. Use distcp to copy HBase table files.
- C. Use distcp to copy physical blocks from the source to the target destination in your cluster.
- D. Use distcp to copy data between directories inside the same cluster.
- E. Use distcp to run an internal MapReduce job to copy files.

**Answer:** B,D,E

NO.6 How does HDFS Federation help HDFS Scale horizontally?

- A. HDFS Federation improves the resiliency of HDFS in the face of network issues by removing the NameNode as a single-point-of-failure.
- B. HDFS Federation allows the Standby NameNode to automatically resume the services of an active NameNode.
- C. HDFS Federation provides cross-data center (non-local) support for HDFS, allowing a cluster administrator to split the Block Storage outside the local cluster.
- D. HDFS Federation reduces the load on any single NameNode by using the multiple, independent NameNode to manage individual parts of the filesystem namespace.

**Answer:** D

NO.7 Choose which best describe a Hadoop cluster's block size storage parameters once you set the HDFS default block size to 64MB?

- A. The block size of files in the cluster can be determined as the block is written.
- B. The block size of files in the Cluster will all be multiples of 64MB.
- C. The block size of files in the duster will all at least be 64MB.
- D. The block size of files in the cluster will all be the exactly 64MB.

**Answer:** D
